BUSINESS REQUIREMENTS DOCUMENT · SYNC ESTATE

Sync Worth v1

Valuations, from instruction to signed report

Requirements for the build team to map Sync Worth v1: instructions, job tracking, inspections, a comparables database, branded reports and sign-off, plus the roadmap to AI-assisted valuation. Kept deliberately simple, to replace Word templates and folders of old reports first, then iterate.

Prepared by LayerSync · 27 October 2026 · Internal · Draft for team review

01 Purpose

Sync Worth v1 gives a valuation team one place to receive instructions, track each job to sign-off, produce a consistent branded report, and reuse past valuations as evidence for the next one.

The problem today

- Instructions arrive by email, phone and WhatsApp, and are tracked in a notebook or spreadsheet. Jobs get forgotten and clients chase for updates.
- Each valuer writes reports from their own Word template, so reports look different, repeat errors and take hours to format.
- Directors cannot see how many jobs are open, who has them, or which are late.
- Comparable sales and past valuations sit in folders on someone's laptop. Finding evidence for a new valuation means asking around or starting from scratch.
- Fees are invoiced late or forgotten, because the job and the invoice are tracked in different places.

> **v1 is successful when** a firm can log an instruction in two minutes, see every open job and its status on one screen, produce a branded report from the job record without retyping, and find every past valuation in a suburb in seconds.

02 Scope

v1 covers residential, commercial and vacant land valuations done by an agency's own valuers, for the common purposes: bank lending, sale or purchase, insurance, rental assessment, and estates.

In v1	Not in v1
Instruction register with purpose, client, property, fee and due date	AI research, suggested values and drafted reports (v2, see section 11)
Assigning jobs to valuers, with status tracking to sign-off	Reading listings from property portals (v2)
Inspection notes and photos captured on a phone	Bank or client portal for submitting instructions
Comparables database built from the firm's own past jobs and sales	Bank-specific report templates (one standard template in v1)
Recording values: market, forced-sale, insurance replacement, rental	Mass/portfolio valuations (many properties in one job)
Standard branded report generated from the job record (PDF)	Digital signatures with certification
Review and sign-off by a signing valuer before issue	Integration with deeds or council records
Valuation fee invoiced through Sync Finance	Mapping and GIS views
Searchable archive of every completed valuation	Offline mode

> **Built for AI from day one:** the long-term aim is AI that researches the market, suggests a value and drafts the report for the valuer to approve or edit (section 11). v1 is where that starts: every job is captured as structured data, and every signed value becomes the history the AI learns from.

03 Users and access

Valuation data is sensitive by default: values, client details and fees are visible only to the valuation team and directors.

User	Access
Director	Everything: all jobs, all valuers, workload, fees and the full archive
Signing valuer (registered)	All jobs; reviews and signs off reports; can return a report for changes
Valuer	Jobs assigned to them; full archive and comparables for research; cannot issue a report without sign-off
Valuations admin	Logs instructions, assigns jobs, chases clients, sends issued reports; cannot change values
Accounts	Sees fees and invoice status only, not values
Other staff (sales, property managers)	No access by default; a director can grant view-only access to issued reports

Rules

- Only a signing valuer can issue a report. The report records who prepared it and who signed it.
- Once issued, a report is locked. Corrections create a new version, and the old one stays on record.
- Clients do not log in to Sync Worth in v1. They receive the issued report by email as a PDF.

04 Core workflow

Every valuation follows the same path. The job's status moves with it, so anyone can see where each job stands: **New → Assigned → Inspected → Draft → In review → Issued**.

01 **Log the instruction.** The admin records who instructed (bank, owner, buyer, lawyer), the purpose, the property, the agreed fee and the date the report is due. Status: New.

02 **Assign a valuer.** The admin or director assigns the job, seeing each valuer's current workload. Status: Assigned.

03 **Inspect the property.** The valuer records inspection notes, measurements and photos on a phone at the property. Status: Inspected.

04 **Gather evidence.** The valuer pulls comparable sales and past valuations nearby from the firm's own database, and adds new evidence found.

05 **Value and write up.** The valuer records the values (market, forced-sale, insurance, rental as needed) with the method and workings, and completes the standard report. Status: Draft.

06 **Review and sign off.** A signing valuer checks the report, approves it or returns it with comments. Status: In review.

07 **Issue the report.** The signed PDF is emailed to the client and locked. Status: Issued.

08 **Invoice the fee.** The fee invoice is raised through Sync Finance (or sent with the report), and payment is tracked against the job.

09 **Archive automatically.** The job, values, photos and comparables used become searchable evidence for every future valuation.

05 Functional requirements

"Must" items are required for v1 to launch. "Should" items go in v1 if time allows, otherwise v1.1.

5.1 Instructions

ID	Requirement	Priority
VW-01	Log an instruction: instructing party (bank, owner, buyer, lawyer, other), contact person, purpose (bank lending, sale/purchase, insurance, rental, estate, other), property, agreed fee, currency, date received, date due	Must
VW-02	Pick the property and client from the Hub's shared records, or create them if new	Must
VW-03	Unique job reference number per agency (e.g. VAL-2026-0142)	Must
VW-04	Cancel or put a job on hold with a reason	Must

5.2 Assignment and tracking

ID	Requirement	Priority
VW-10	Assign a job to a valuer, showing how many open jobs each valuer has	Must
VW-11	Job status: New, Assigned, Inspected, Draft, In review, Issued, plus On hold and Cancelled	Must
VW-12	Flag jobs approaching or past their due date; remind the assigned valuer	Must
VW-13	Notes and activity log per job (calls, client queries, access arrangements)	Must

5.3 Inspection

ID	Requirement	Priority
VW-20	Inspection form on a phone: date, attendees, property type, construction, condition, accommodation, services, land size, building areas, notes	Must
VW-21	Photos taken or uploaded at the property, compressed for weak connections	Must
VW-22	Save as draft and finish later	Must
VW-23	Attach supporting documents: title deed, plans, lease, rates statement	Must

5.4 Comparables and evidence

ID	Requirement	Priority
VW-30	Comparables database: sale or rental evidence with address, suburb, property type, land size, building size, price, date, source and notes	Must
VW-31	Every issued valuation is added to the database automatically as evidence	Must
VW-32	Search comparables by suburb, property type, size range, value range and date range	Must
VW-33	Select comparables for a job; they appear in the report's evidence table	Must
VW-34	Import existing comparables and past valuations from Excel at go-live	Must
VW-35	Pull closed sales and rentals from SynCRM and Sync Stay into the database as evidence	Should

5.5 Values and workings

ID	Requirement	Priority
VW-40	Record the values the purpose needs: market value, forced-sale value, insurance replacement value, market rental, each with currency	Must
VW-41	Record the method used (comparison, income, cost) and a workings section in the report	Must
VW-42	Simple calculators: comparison (adjusted rate per square metre from selected comparables), income (net rent capitalised at a chosen yield), cost (land value plus building replacement cost less depreciation)	Should
VW-43	Values are never typed into the report text directly; the report reads them from the job, so figures always match	Must

5.6 Report

ID	Requirement	Priority
VW-50	Generate a branded PDF report from the job: cover, instruction and purpose, property description, inspection, photos, evidence table, valuation and workings, assumptions and limiting conditions, values, signatures	Must
VW-51	Standard wording for assumptions, limiting conditions and disclaimers, set once by the agency and reused	Must
VW-52	Valuer can edit narrative sections (location, description, market commentary) before review	Must
VW-53	One standard report template in v1, with a short-form version for simple residential jobs	Should

5.7 Review, sign-off and issue

ID	Requirement	Priority
VW-60	Valuer submits the draft for review; signing valuer approves or returns it with comments	Must
VW-61	On approval, the report shows the preparing and signing valuer's names and registration numbers, and a scanned signature	Must
VW-62	Issued reports are locked; any correction creates a new numbered version with a reason	Must
VW-63	Email the issued report to the client from the system, with a record of when it was sent	Must

5.8 Fees

ID	Requirement	Priority
VW-70	Agreed fee recorded on the job; on issue, the fee is sent to Sync Finance to invoice	Must
VW-71	Without Sync Finance: generate a simple fee invoice PDF from the job and mark it paid or unpaid	Must
VW-72	Option to hold the report until the fee is paid (agency setting)	Should

06 Dashboard and reports

Valuations dashboard (also feeds the Hub director dashboard)

- Open jobs by status, and jobs overdue or due this week
- Workload per valuer: open jobs and jobs issued this month
- Average turnaround: days from instruction to issue
- Fees: issued this month, invoiced, unpaid

Valuer's home screen: my jobs by due date, with one tap to start an inspection.

Reports (export to PDF and Excel)

- **Instruction register:** every job in a date range, with client, purpose, valuer, status, fee
- **Turnaround report:** time spent at each stage, by valuer and by client
- **Work by instructing party:** jobs and fees per bank or client, useful for managing bank panel relationships
- **Unpaid fees:** issued jobs not yet paid, by age
- **Evidence report:** comparables and past values in a suburb over a period

07 Data

The business records v1 needs; the build team designs the schema. Records marked Hub are shared across modules.

Record	Key fields	Owner
Contact (client, instructing party)	Name, type (bank, individual, company, lawyer), contact person, phone, email	Hub
Property	Address, suburb, type, land size, title details	Hub

Record	Key fields	Owner
Valuation job	Reference, client, property, purpose, fee, currency, dates (received, due, issued), assigned valuer, signing valuer, status, version	Sync Worth
Inspection	Job, date, attendees, construction, condition, accommodation, services, building areas, notes, photos	Sync Worth
Comparable	Address, suburb, type, land size, building size, price or rent, date, source, linked job (if from a past valuation)	Sync Worth
Valuation result	Job, market value, forced-sale value, insurance value, market rental, method, workings, comparables used	Sync Worth
Report	Job, version, PDF, prepared by, signed by, issued date, sent to, correction reason	Sync Worth
Valuer profile	User, registration number, signature image, qualifications	Sync Worth
Document	Linked record, file, type, uploaded by, date	Hub

08 Integrations

Sync Worth works on its own, and gets more useful as the firm's other modules feed it evidence.

Connects to	Direction	What flows
Sync Estate Hub	Both	Login and roles, shared clients and properties, documents, notifications, dashboard figures (open jobs, overdue, fees)
Sync Finance	Worth → Finance	Valuation fee on issue, so it is invoiced and tracked as agency income
Sync Finance	Finance → Worth	Invoice and payment status, shown on the job
SynCRM	CRM → Worth	Closed sales (price, date, property details) added as comparable evidence
SynCRM	Worth → CRM	Optional: when an owner gets a valuation, a sales follow-up can be created (a seller lead)
Sync Stay	Stay → Worth	Current rents on managed units, as rental evidence

> **Why this matters for the pitch:** no standalone valuation tool has the firm's own sales and rental data built in. A Sync Estate firm's valuers draw on every deal the agency has done.

09 Non-functional requirements and acceptance

Non-functional

- **Confidentiality:** valuation data restricted by role on the server; every view of an issued report by non-valuation staff is logged.

- **Integrity:** issued reports cannot be edited or deleted; every version is kept with who changed it and why.
- **Mobile-friendly and low bandwidth:** inspections done on a phone over a weak connection; photos compressed on upload.
- **Reports:** branded with the agency's logo, print cleanly on A4, and stay readable at a typical 15–25 pages with photos.
- **Currency:** every value and fee carries its currency (USD or ZiG).
- **Multi-tenant, daily backups:** same standard as the rest of Sync Estate. Each firm's comparables are private to that firm.

v1 is accepted when a firm can do all of this without Word templates or a spreadsheet

- [ ] Import its past valuations and comparables from Excel
- [ ] Log an instruction with its purpose, fee and due date
- [ ] Assign the job and see every valuer's workload
- [ ] Complete an inspection with photos on a phone
- [ ] Find comparables in a suburb and add them to the job
- [ ] Produce the full branded report from the job record
- [ ] Review, sign off and email the issued report, locked
- [ ] Invoice the fee and see whether it has been paid
- [ ] Search the archive and find a past valuation in seconds

10 Open questions

For Andre and Tino

- [ ] Report generation: best way to produce long, photo-heavy branded PDFs reliably (HTML-to-PDF or a document library)?
- [ ] Can the inspection and photo component built for Sync Stay be reused here?
- [ ] Photo and document storage: valuations will hold many photos per job; same storage approach and limits as Sync Stay?
- [ ] Realistic build estimate for the Must items, and which Should items fit

To confirm with valuers (Stonebridge is the obvious first conversation)

- [ ] Two or three sample reports, with client details removed, to model our standard template and short-form version on
- [ ] What banks require in a lending valuation, and whether any bank insists on its own format
- [ ] Signing rules: does every report need a registered valuer's signature and registration number, and is a scanned signature acceptable?
- [ ] Which values they report most: market, forced-sale, insurance, rental, and how forced-sale value is usually set
- [ ] Do clients pay before the report is released, or after?

> **Pricing note:** valuation teams are small (often 1–3 valuers), so per-user pricing earns little from Sync Worth. Worth considering whether it is priced per user like the other modules, or by jobs per month.

11 Roadmap: AI-assisted valuation (v2)

Where Sync Worth is heading: the AI does the research and the first draft; the valuer judges, edits and signs. This is the main reason a firm would choose Sync Worth over a template and a spreadsheet.

How it will work

01 **Reads the job.** Inspection data, photos and property details captured in v1.

02 **Checks history.** The firm's own past valuations and comparables, plus closed sales from SynCRM and rents from Sync Stay.

03 **Researches the market.** Finds listings for similar properties (same and nearby suburbs, similar type, size and condition) on property portals and other public sources.

04 **Adjusts.** Converts asking prices to likely selling prices, using the gap between asking and achieved prices in the firm's own data, and adjusts for size, condition and date.

05 **Drafts.** Suggests the value (with a range), shows the comparables and adjustments used, explains its reasoning, and drafts the report's narrative sections.

06 **Valuer decides.** Accepts, edits any figure or wording, or rejects with a reason. The signing valuer signs off exactly as in v1.

07 **Learns.** Every suggestion is stored next to the final signed value and the valuer's edits, so future suggestions move closer to the firm's own judgement.

What v1 must get right so v2 works

- Capture everything as structured fields (sizes, condition, accommodation, values), not just free text.
- Store each comparable with the adjustments the valuer made to it.
- Record the final signed values and dates on every job; this is the history the AI learns from.
- Import past valuations cleanly at go-live, so the AI has history from the start.

To settle before building v2

- [ ] **Portal data.** Reading listings from property portals may breach their terms of use, and PropertyBook and Property.co.zw are launching their own CRM, so they may block access. Options: a data agreement with a portal, licensed data, or research limited to public listings and the firm's own data.
- [ ] **What "learning" means in practice.** Most likely the AI uses the firm's own history as examples and calibration, rather than us training a new model. It still improves as each firm's data grows. Sales material should describe it that way.
- [ ] **Accountability.** The signing valuer stays responsible for the value. Every AI suggestion and its reasoning is kept on the job record for audit, and the report states the value is the valuer's opinion.
- [ ] **Enough data.** Converting asking to selling prices reliably needs a base of achieved prices per area. Agree how many signed jobs a firm needs before suggested values are switched on.
